The two sets of mxd's/msd's are ready to be uploaded to the RTP server. Did we want to put them straight onto Orator or onto Staging first or was there another plan?

Subject: IPAD Mapping Application

We are doing testing and building the a mapping application piece to an IPAD app and wanted to test bringing in services from Los Conchas and the Floods response services.

We have added all the separate services for each layer but we were wondering if you could put all the layers into one service. Right now there are multiple services within the hosting folder. You can keep these services the way they are but if you could host one service with all the layers this would help with our development. We are going to test to see which way is better to bring in with the JSON.

Let me know if you think you can help us out. We would need it pushed to Orator then for further testing.

Thanks.
